

Read this out loud.

Three minutes, eight slides. The words are written to be read exactly as they are. If you lose your place, the **highlighted** words are the ones that matter.

1	Title — Divergence Engine	0:00
2	The problem	0:20
3	Abdullah Al-Mansoori	0:42
4	Four holdings. Two asset classes. One bet.	1:04
5	Everything is inside its limits	1:32
6	If the Strait reopens	2:00
7	The AI reads and writes. It never counts.	2:24
8	Running it inside a bank	2:44
	Q & A	2:00

Slides **4** and **5** are the argument. If you are running long, hurry slides 2 and 7 – never those two.

1

0:00

Slide: Title — Divergence Engine

Good evening.

Every bank checks a portfolio against the mandate.

Nobody checks it against what the client actually said.

I'll show you one client where those two things are opposites — and every control in the bank says he is fine.

2

0:20

Slide: The problem

Bank systems raise an alarm when a rule is broken.
That works.

What they cannot catch is a portfolio that follows every rule and is still the wrong portfolio for the person who owns it — because there is no alarm to raise.

Priscilla here looks after twenty families. She can properly watch about three.

Abdullah Al-Mansoori made his money in Gulf shipping – ports, cargo, chartering vessels.

When he opened his account in 2014 he asked for one thing, and the bank wrote it down: build wealth outside the Gulf, and outside shipping.

His business already rises and falls with Gulf shipping. He wanted a cushion – not a second copy of the same bet.

Today, forty-two per cent of his portfolio is shipping and energy.

It hides because it is four separate holdings, sitting in only two asset classes. And one of them is a structured note whose basket references two companies he already owns outright.

So it looks like a fourth investment. It is the same bet, bought twice.

Look through it, and it is forty-two point one three per cent.

5

1:32

Slide: Everything is inside its limits

Here is the part that matters.

Every mandate band is respected. His largest position is thirteen point three per cent, against a fifteen per cent limit. There is no breach anywhere.

Nothing in the bank's monitoring would ever raise this.

That gap – between compliant, and what the client actually asked for – is the whole product.

6

2:00

Slide: If the Strait reopens

And it is urgent.

On the twelfth of August he asked what happens if the Middle East calms down. The note in the file says: we have not modelled this. Nobody got back to him.

So we did. If oil returns to pre-conflict levels he loses about two and a half million – on good news. And his charter rates fall in the same week.

7

2:24

Slide: The AI reads and writes. It never counts.

On trust. The AI reads and writes — **it never counts.**

Every figure is ordinary code. **A hundred and eight tests**, and not one of them reads an AI output.

Every finding carries the file and the row it came from. And **Priscilla decides** — the system never contacts a client, and never moves money.

8

2:44

Slide: Running it inside a bank

It runs as an overnight batch. No live model, no database.

And **seven of the twenty** clients are reported as having nothing to raise — because a system that finds something wrong with everyone gets ignored by Thursday.

Thank you.

If your mind goes blank

Say these three things.

Any slide, any order. This is the whole pitch. Then stop and ask if they would like the detail.

Every bank checks the portfolio against the mandate. Nobody checks it against what the client **said**.

This client asked to stay out of Gulf shipping. Forty-two per cent of his portfolio is shipping and energy – and **every single control passes**.

We find that, show the records it came from, and hand the banker a sentence to open the call.

And if you forget a number

Say **“about forty per cent”** rather than guess a decimal. The exact figure is on the slide behind you, and the judges can read it.

Never invent a figure you are not sure of. **“It is on the slide – forty-two point one three”** is a fine thing to say.

Q & A

Answer in one or two sentences, then stop. A short answer invites the next question; a long one uses your two minutes.

Q How is this different from existing risk or compliance tools?

A Those fire when a rule breaks. This one finds the portfolios where **no rule breaks** and it is still wrong. On this client every band passes — that is the point, not a coincidence.

Q Can the AI make up a number?

A No. It never sees arithmetic and never produces one. Every figure is computed in Python and tested. If the AI is wrong you get a clumsy sentence, not a wrong figure.

Q Would a bank's compliance team allow the AI?

A It can be switched off entirely and the numbers do not change — briefs just get plainer. In production it runs inside the bank's own cloud, and never sees a client's name or account.

Q What if the relationship manager's notes are poor?

A Then the notes detector gets nothing, and I would say so rather than pretend. That is change management, not engineering. The look-through and the scenario need no notes at all — they would go live first.

Q Does it scale?

A It is an overnight batch, parallel by client. At a hundred thousand clients the AI cost is roughly **thirteen dollars per client per year** at the ceiling, and most nights it is far less because unchanged clients are skipped.

Q What is not built?

A The live connections to bank systems, logins, and the security plumbing a bank requires. Known work — and I have not done it. The detection logic and all the arithmetic are built and tested.

Q Why this client and not the one in the brief?

A The brief's own worked example will be demoed by every team. I picked the client where the finding is invisible to every existing control.

If you do not know

“I don't know – I'd have to check.” That is a good answer here. The whole project is built on not inventing figures, so saying it out loud is consistent, not weak.
