Divergence Engine

Every bank checks the portfolio against the mandate. **Nobody checks it against what the client actually said.**

Which client to call first · what is wrong · how to open the conversation
web-aljs-projects.vercel.app · youtu.be/q_8llE6ZkaU

The problem

The portfolios worth a phone call break no rule.

- Bank systems raise an alarm when something is against the rules. That catches a lot.
- They cannot catch a portfolio that follows every rule and is still the wrong portfolio for the person who owns it.
- There is no alarm to raise.

Priscilla Ong, Asia desk

20 families · USD 8.2m to 87.9m

She can properly watch about three.

The portfolio that most needs her this morning breaks none of her rules.

- He asked a question on 12 August. It still has no answer.

Abdullah Al-Mansoori

49 · Balanced Growth, advisory · USD 32.2m · client since 2014 · Gulf logistics, port services and marine chartering

His objective, in the bank's own file since 2014

“Build wealth **outside the Gulf region**
and **outside the shipping sector**; fund a
family office in Asia.”

His business already rises and falls with Gulf shipping. He asked for a cushion, not a second copy of the same bet.

What he actually holds · as at 26 August 2026

Four holdings. Two asset classes. One bet.

Energy and industrials — against an objective of staying out of both. On any report grouped by asset class, there are only two groups, so nothing stands out.

Against his mandate, today

Everything is inside its limits.

All five bands respected. No single-name breach – the largest position is 13.30% against a 15% limit. Nothing the bank monitors would raise this, and the portfolio is still 42% one bet.

His question, from note N-026 · 12 August 2026 — “We have not modelled this.”

If the Strait reopens, good news costs him 2.5 million.

Brent back from 101.5 to 72.4 – a de-escalation. And in the same week calmer shipping lanes mean lower charter rates, so his business earns less too. He said so himself, in a note from April.

The diversification he asked for in 2014 is exactly what would have covered this.

Why it can be trusted

The AI reads and writes. It never counts.

- Every figure is ordinary code, not a model. 108 tests, and none of them reads a model output.
- Every finding carries its evidence — the file, the row, the value. One that cannot returns nothing.
- The AI can be switched off and the numbers do not change.
- The relationship manager decides. Keep, reject, or add a note.
- It never contacts a client and never moves money. No code exists that could.
- 7 of 20 clients are reported as having nothing to raise. A system that flags everyone gets ignored by Thursday.

24 model calls in the whole system, all before anyone logs in, all committed with the prompt and settings that produced them.

Running it inside a bank

An overnight batch. No live model, no database, nothing on the wire.

Hosting on AWS, Google Cloud or Azure · data protection · cost at 100,000 clients · a four-phase rollout where no client's details reach a model until phase three
